

Comparative Advantage and Specialization

TRADE

We have learned enough about production that we can now begin our explanation of trade.

TRADE

- Assumptions

Let's assume there are two products (Food

TRADE

the main question:

To be self-sufficient and produce everything we need

To cooperate with the other country &

TRADE

Trade is beneficial if one can only produce food while the other can only produce computer.

Computers	Food	Computers	Food
200	0	400	0
100	200	200	100
0	400	0	200

TRADE

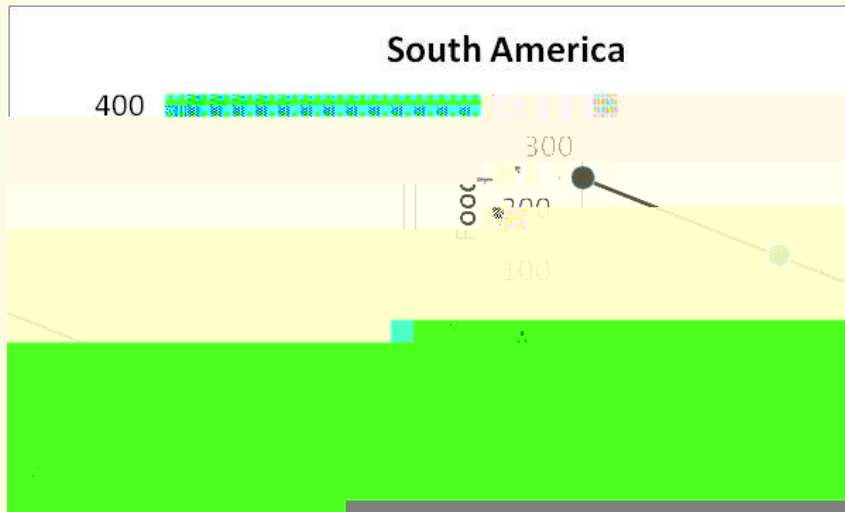

But what happens if one is much better in producing both computers and food?

A different example

Computers	Food	Computers	Food
250	0	200	0
125	125	100	50
0	250	0	100

They can still benefit from trade as long as opportunity costs are different.

Opportunity Costs

What is the opp. cost of 1 food in Europe?

If you pick to produce 100 units of food ...
you give up producing 200 computers.

vs.

Opportunity Costs

100

So the opportunity cost of _____ units of food is _____ computers.

So, what are opportunity costs in South America?

South America could produce a maximum of 250 food units. BUT to do so they have to give up 250 units of computer.

So, the cost of 250 units of food is 250 computers.

Or, the opportunity cost of 1 food is 1 computer.

Opportunity cost of a computer in South America?

South America could produce a maximum of 250 computers. BUT to do so they have to give up 250 units of food.

So, the cost of 250 computers is 250 units of food.

That means that the opportunity cost of each unit of 1 food is 1 computer.

So, what are opportunity costs?

Specialize in what your opportunity cost is

Absolute vs. Comparative Advantage

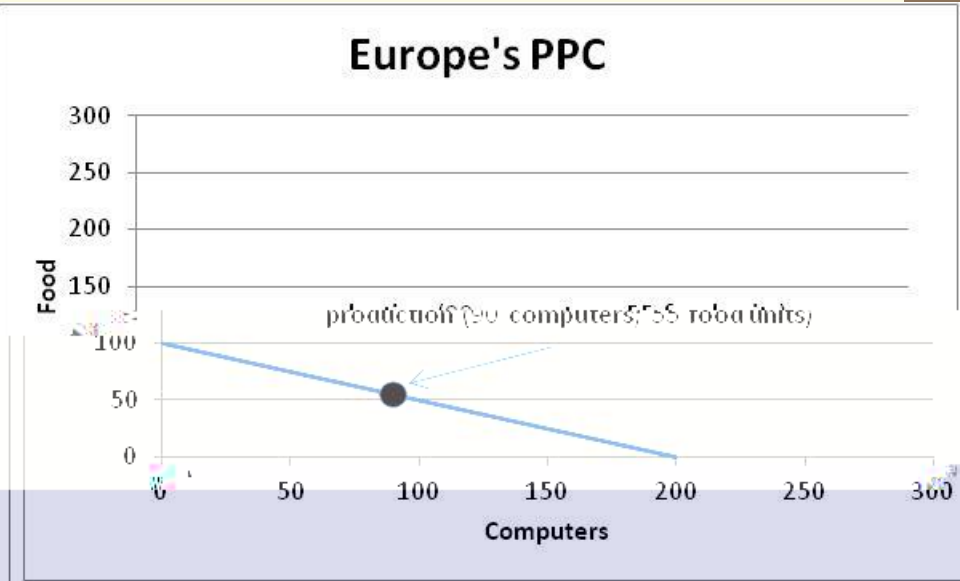

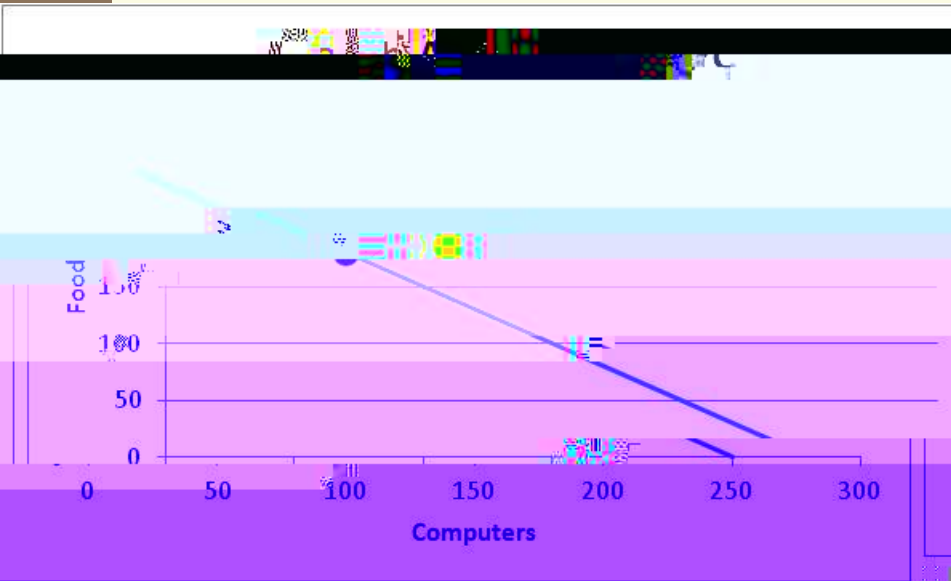

The ability of an individual, firm, or country **to produce more** of a good or service than competitors **using the same** amount of **resources**.

The ability of an individual, firm, or country **to produce** a good or service **at a lower opportunity cost** than other producers.

TRADE

What if there is no trade?

		South America		Europe	
		Computer	Food	Computer	Food
NO Trade	Production	70	180	90	55
	Consumption	70	180	90	55

TRADE

Let's introduce trade instead.

Specialize and trade 66 units of food for 99 computers.

		South America		Europe	
Computer	Food	Computer	Food	Computer	Food
0	200	200	0	With Trade	Production
99	184	101	66		Consumption

Gains from TRADE

		South America		Europe	
		Computer	Food	Computer	Food
NO Trade	Production	70	180	90	55
	Consumption	70	180	90	55
		South America		Europe	
		Computer	Food	Computer	Food
With Trade	Production	0	250	200	0
	Consumption	99	184	101	66

Gains from TRADE with Graphs

South America's PPC

Europe's PPC

computers

Trade

You may now ask: "But where did you come up with that they should trade 66 food units for 99 computers?"

Excellent question.

66 Food units for 99 computers is equivalent to each 1 food for 1.5 computers, right? Right.

And that comes from the opportunity cost table.

Trade will only make both countries better off if the 'price' in trade is between the two opp. costs.

Trade pattern

Items to be traded

A diagram illustrating a trade pattern. It features a large black rectangular area. At the top of this area is a white horizontal bar containing the text "Items to be traded". At the bottom of the black area is a red horizontal oval. A thin horizontal line is positioned above the black area, extending across the width of the diagram.

Should the United States trade with other countries?

As we all know Americans enjoy a lot of goods produced by other countries.

Imports: goods produced abroad and sold domestically.

Exports: goods produced domestically and sold abroad.
